INSTITUTE OF DISTANCE AND OPEN LEARNING (IDOL)**

PRACTICAL JOURNAL IN PAPER - IV

SOFT COMPUTING TECHNIQUES

**SUBMITTED BY
PRAMOD R. SHARMA
APPLICATION ID :6647
SEAT NO:508144**

**MASTERS OF SCIENCE IN INFORMATION TECHNOLOGY PART-1
SEMESTER-1**

**ACADEMIC YEAR
2022-2023**

**INSTITUTE OF DISTANCE AND OPEN LEARNING
IDOL BUILDING, VIDYANAGRI,
SANTACRUZ(EAST), MUMBAI-400 098**

**CONDUCTED AT
RIZVI COLLEGE OF ARTS, SCIENCE AND COMMERCE
BANDRA(W), MUMBAI- 400050**

**UNIVERSITY OF MUMBAI
INSTITUTE OF DISTANCE AND OPEN LEARNING (IDOL)**

**Dr. Shankar Dayal Sharma Bhavan, Kalina
Vidyanagri, Santacruz(E), Mumbai-400 098**

Certificate

This is to certify that

Mr. **Pramod Radheshyam Sharma** Application ID: **6647**, Seat No: **508144** - from Rizvi College of Arts, Science and Commerce Bandra(W), Mumbai 400 050 has successfully completed practical Paper **IV** titled **SOFT COMPUTING TECHNIQUES** for M.sc (IT) Part1 semester 1 in the academic year 2022-2023.

M.sc (IT) Co-Ordinator, IDOL

INDEX

SR.NO	PRACTICAL AIM	SIGNATURE
1	Implement the following: a. Design a simple linear neural network model. b. Calculate the output of neural net using both binary and bipolar sigmoidal function.	
2	Implement the following: a. Generate AND/NOT function using McCulloch-Pitts neural net. b. Generate XOR function using McCulloch-Pitts neural net.	
3	Implement the Following a. Write a program to implement Hebb's rule. b. Write a program to implement of delta rule.	
4	Implement the Following a. Write a program for Back Propagation Algorithm b. Write a program for error Backpropagation algorithm.	
5	Implement the Following a. Write a program for Hopfield Network. b. Write a program for Radial Basis function	
6	Implement the Following a. Kohonen Self organizing map b. Adaptive resonance theory	
7	Implement the Following a. Write a program for Linear separation.	
8	Implement the Following a. Membership and Identity Operators in, not in, b. Membership and Identity Operatorsis, is not	
9	Implement the Following a. Find ratios using fuzzy logic b. Solve Tipping problem using fuzzy logic	
10	Implement the Following a. Implementation of Simple genetic algorithm b. Create two classes: City and Fitness using Genetic algorithm	

Practical 1

Practical 1 a: Design a simple linear neural network model.

```
x=float(input("Enter value of x:"))  
w=float(input("Enter value of weight w:"))  
b=float(input("Enter value of bias b:"))  
net = int(w*x+b)  
if(net<0):  
    out=0  
elif((net>=0)&(net<=1)):  
    out =net  
else:  
    out=1  
print("net=",net)  
print("output=",out)
```

Practical 1 b: Calculate the output of neural net using both binary and bipolar sigmoidal function

Code :

```
# number of elements as input
```

```
n = int(input("Enter number of elements : "))
```

```
# In[2]:
```

```
print("Enter the inputs")
```

```
inputs = [] # creating an empty list for inputs
```

```
# iterating till the range
```

```
for i in range(0, n):
```

```
    ele = float(input())
```

```
    inputs.append(ele) # adding the element
```

```
print(inputs)
```

```
# In[3]:
```

```
print("Enter the weights")
```

```
# creating an empty list for weights
```

```
weights = []
```

```
# iterating till the range
```

```
for i in range(0, n):
```

```
    ele = float(input())
```

```
    weights.append(ele) # adding the element
```

```
print(weights)
```

```
# In[4]:
```

```
print("The net input can be calculated as  $Y_{in} = x_1w_1 + x_2w_2 + x_3w_3$ ")
```

```
# In[5]:
```

```
Yin = []
```

```
for i in range(0, n):
```

```
    Yin.append(inputs[i]*weights[i])
```

```
print(round(sum(Yin),3))
```

Output :

```
Enter number of elements : 3
Enter the inputs
0.3
0.5
0.6
[0.3, 0.5, 0.6]
Enter the weights
0.2
0.1
-0.3
[0.2, 0.1, -0.3]
The net input can be calculated as  $Y_{in} = x_1w_1 + x_2w_2 + x_3w_3$ 
-0.07
```

Practical 2

Practical 2 a: Implement AND/NOT function using McCulloch-Pits neuron (use binary data representation).

Code:

```
# enter the no of inputs
num_ip = int(input("Enter the number of inputs : "))
#Set the weights with value 1
w1 = 1
w2 = 1
print("For the ", num_ip , " inputs calculate the net input using  $y_{in} = x_1w_1 + x_2w_2$  ")
x1 = []
x2 = []
for j in range(0, num_ip):
    ele1 = int(input("x1 = "))
    ele2 = int(input("x2 = "))
    x1.append(ele1)
    x2.append(ele2)
print("x1 = ",x1)
print("x2 = ",x2)
n = x1 * w1
m = x2 * w2
Yin = []
for i in range(0, num_ip):
    Yin.append(n[i] + m[i])
print("Yin = ",Yin)
#Assume one weight as excitatory and the other as inhibitory, i.e.,
Yin = []
for i in range(0, num_ip):
    Yin.append(n[i] - m[i])
print("After assuming one weight as excitatory and the other as inhibitory Yin = ",Yin)
#From the calculated net inputs, now it is possible to fire the neuron for input (1, 0)
#only by fixing a threshold of 1, i.e.,  $\theta \geq 1$  for Y unit.
#Thus,  $w_1 = 1, w_2 = -1; \theta \geq 1$ 
Y=[]
for i in range(0, num_ip):
    if(Yin[i]>=1):
        ele= 1
    Y.append(ele)
    if(Yin[i]<1):
        ele= 0
    Y.append(ele)
print("Y = ",Y)
```

Output :

```
Enter the number of inputs : 4
For the 4 inputs calculate the net input using  $y_{in} = x_1w_1 + x_2w_2$ 

x1 = 0
x2 = 0
x1 = 0
x2 = 1
x1 = 1
x2 = 0
x1 = 1
x2 = 1
x1 = [0, 0, 1, 1]
x2 = [0, 1, 0, 1]
Yin = [0, 1, 1, 2]
After assuming one weight as excitatory and the other as inhibitory Yin = [0, 1, -1, 0]
Y = [0, 1, 0, 0]

In [14]: |
```

Practical 2 b: Generate XOR function using McCulloch-Pitts neural net

XOR Network

The XOR (exclusive or) function is defined by the following truth table:

Input1	Input2	XOR Output
0	0	0
0	1	1
1	0	1
1	1	0

#Getting weights and threshold value

```

import numpy as np
print('Enter weights')
w11=int(input('Weight w11='))
w12=int(input('weight w12='))

w21=int(input('Weight w21='))
w22=int(input('weight w22='))
v1=int(input('weight v1='))
v2=int(input('weight v2='))
print('Enter Threshold Value')
theta=int(input('theta='))
x1=np.array([0, 0, 1, 1])
x2=np.array([0, 1, 0, 1])

con=1
y1=np.zeros((4,))
y2=np.zeros((4,))
y=np.zeros((4,))
while con==1:
    zin1=np.zeros((4,))
    zin2=np.zeros((4,))
    zin1=x1*w11+x2*w21
    zin2=x1*w21+x2*w22
    print("z1",zin1)
    print("z2",zin2)
    for i in range(0,4):
        if zin1[i]>=theta:
            y1[i]=1
        else:
            y1[i]=0
        if zin2[i]>=theta:
            y2[i]=1
        else:
            y2[i]=0
    yin=np.array([])
    yin=y1*v1+y2*v2
    for i in range(0,4):
        if yin[i]>=theta:
            y[i]=1
        else:
            y[i]=0
    print("yin",yin)
    print('Output of Net')
    y=y.astype(int)
    print("y",y)
    print("z",z)

```

```

if np.array_equal(y,z):
    con=0
else:
    print("Net is not learning enter another set of weights and Threshold value")
    w11=input("Weight w11=")
    w12=input("weight w12=")

    w21=input("Weight w21=")
    w22=input("weight w22=")

    v1=input("weight v1=")
    v2=input("weight v2=")
    theta=input("theta=")
    print("McCulloch-Pitts Net for XOR function")
    print("Weights of Neuron Z1")
    print(w11)
    print(w21)
    print("weights of Neuron Z2")
    print(w12)
    print(w22)
    print("weights of Neuron Y")
    print(v1)
    print(v2)
    print("Threshold value")
    print(theta)

```

Output :

```

Enter weights
Weight w11=1
Weight w12=-1
Weight w21=-1
Weight w22=1
Weight v1=1
Weight v2=1
Enter Threshold Value
theta=1
z1 [ 0 -1 1 0]

1

```

Practical 3

Practical 3 a: Write a program to implement Hebb's rule

Using the Hebb rule, find the weights required to perform the following classifications of the given input patterns shown in Figure 16. The pattern is shown as 3×3 matrix form in the squares. The "+" symbols represent the value "1" and empty squares indicate "-1." Consider "I" belongs to the members of class (so has target value 1) and "O" does not belong to the members of class (so has target value -1).

+	+	+
	+	
+	+	+

I

+	+	+
+		+
+	+	+

O

```
import numpy as np
#first pattern
x1=np.array([1,1,1,-1,1,-1,1,1,1])
#second pattern
x2=np.array([1,1,1,1,-1,1,1,1,1])
#initialize bias value
b=0
#define target
y=np.array([1,-1])
wtold=np.zeros((9,))
wtnew=np.zeros((9,))
wtnew=wtnew.astype(int)
wtold=wtold.astype(int)
bais=0
print("First input with target =1")
for i in range(0,9):
    wtold[i]=wtold[i]+x1[i]*y[0]
    wtnew=wtold
    b=b+y[0]
print("new wt =", wtnew)
print("Bias value",b)
```

```

print("Second input with target =-1")
for i in range(0,9):
    wtnew[i]=wtold[i]+x2[i]*y[1]
b=b+y[1]
print("new wt =", wtnew)
print("Bias value",b)

```

Output :

```

First input with target =1
new wt = [ 1  1  1 -1  1 -1  1  1  1]
Bias value 1
Second input with target =-1
new wt = [ 0  0  0 -2  2 -2  0  0  0]
Bias value 0

```

Practical 3 b: Write a program to implement of delta rule

```

#supervised learning
import numpy as np
import time
np.set_printoptions(precision=2)
x=np.zeros((3,))
weights=np.zeros((3,))
desired=np.zeros((3,))
actual=np.zeros((3,))
for i in range(0,3):
    x[i]=float(input("Initial inputs:"))
for i in range(0,3):
    weights[i]=float(input("Initial weights:"))
for i in range(0,3):
    desired[i]=float(input("Desired output:"))
a=float(input("Enter learning rate:"))
actual=x*weights
print("actual",actual)
print("desired",desired)
while True:
    if np.array_equal(desired,actual):
        break #no change
    else:
        for i in range(0,3):
            weights[i]=weights[i]+a*(desired[i]-actual[i])
        actual=x*weights
        print("weights",weights)

```

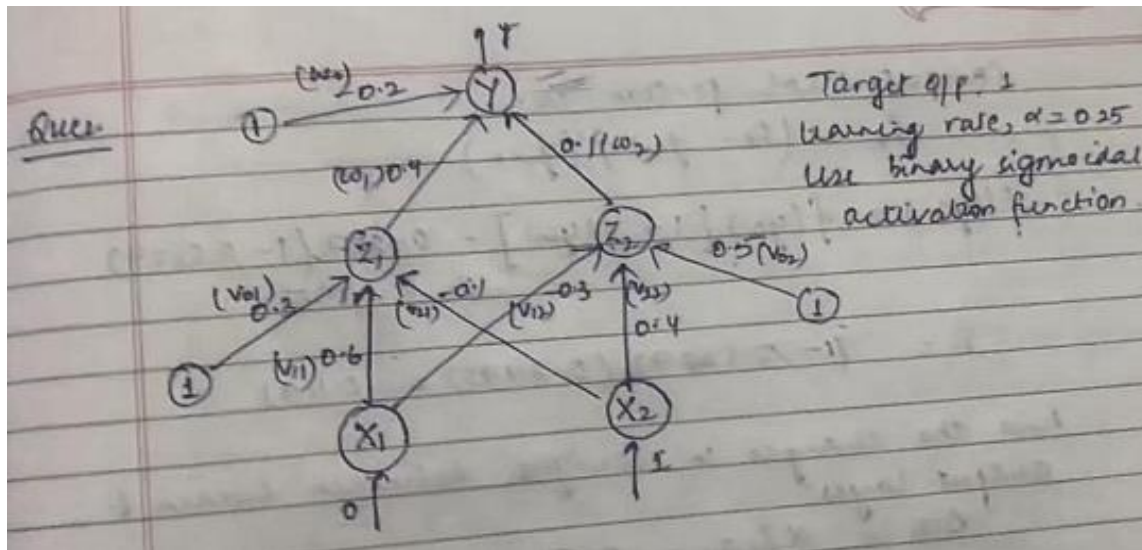

```
print("actual",actual)
print("desired",desired)
print("***30)

Output :

Practical 6

Practical 6 a: Self-Organizing Maps

The SOM algorithm is used to compress the information to produce a similarity graph while preserving the topologic relationship of the input data space. The basic SOM model construction algorithm can be interpreted as follows: 1) Create and initialize a matrix (weight vector) randomly to hold the neurons. If the matrix can be initialized with order and roughly compiles with the input density function, the map will converge quickly 2) Read the input data space. For each observation (instance), use the optimum fit approach, which is based on the Euclidean distance $c = \arg \min \|x - m_i\|$ to find the neuron which best matches this observation. Let x denote the training vector from the observation and m_i denote a single neuron in the matrix. Update that neuron to resemble that observation using the following equation: $m_i(t+1) = m_i(t) + h(t)[x(t) - m_i(t)]$ (4) $m_i(t)$: the weight vector before the neuron is updated. $(t+1)$: the weight vector after the neuron is updated. (t) : the training vector from the observation. $h(t)$: the neighborhood function (a smoothing kernel defined over the lattice points), defined though the following equation: $h(t) = \{ \alpha(t), i \in N_c, 0, i \in N_c$ (5) : the neighborhood set, which decreases with time. (t) : the learning-rate factor which can be linear, exponential or inversely proportional. It is a monotonically decreasing function of time (t)

In general, SOMs might be useful for visualizing high-dimensional data in terms of its similarity structure. Especially large SOMs (i.e. with large number of Kohonen units) are known to perform mappings that preserve the topology of the original data, i.e. neighboring data points in input space will also be represented in adjacent locations on the SOM. The following code shows the 'classic' color mapping example, i.e. the SOM will map a number of colors into a rectangular area.

from mvpa2.suiteimport *

First, we define some colors as RGB values from the interval (0,1), i.e. with white being (1, 1, 1) and black being (0, 0, 0). Please note, that a substantial proportion of the defined colors represent variations of 'blue', which are supposed to be represented in more detail in the SOM.

```
colors=np.array(
[[0.,0.,0.],
[0.,0.,1.],

[0.,0.,0.5],
[0.125,0.529,1.0],
[0.33,0.4,0.67],
[0.6,0.5,1.0],
[0.,1.,0.],
[1.,0.,0.]
```

```
[0.,1.,1.],
[1.,0.,1.],
[1.,1.,0.],
[1.,1.,1.],
[.33,.33,.33],
[.5,.5,.5],
[.66,.66,.66]])
# store the names of the colors for visualization later on
color_names= \
['black','blue','darkblue','skyblue',
'greyblue','lilac','green','red',
'cyan','violet','yellow','white',
'darkgrey','mediumgrey','lightgrey']
```

Now we can instantiate the mapper. It will internally use a so-called Kohonen layer to map the data onto. We tell the mapper to use a rectangular layer with 20 x 30 units. This will be the output space of the mapper. Additionally, we tell it to train the network using 400 iterations and to use custom learning rate.

```
som=SimpleSOMMapper((20,30),400,learning_rate=0.05)
```

Finally, we train the mapper with the previously defined ‘color’ dataset.

```
som.train(colors)
```

Each unit in the Kohonen layer can be treated as a pointer into the high-dimensional input space, that can be queried to inspect which input subspaces the SOM maps onto certain sections of its 2D output space. The color-mapping generated by this example’s SOM can be shown with a single matplotlib call:

```
pl.imshow(som.K,origin='lower')
```

And now, let’s take a look onto which coordinates the initial training prototypes were mapped to. To get those coordinates we can simply feed the training data to the mapper and plot the output

```
mapped=som(colors)
pl.title('Color SOM')
# SOM's kshape is (rows x columns), while matplotlib wants (X x Y)
for i,minenumerate(mapped):
    pl.text(m[1],m[0],color_names[i],ha='center',va='center',
    bbox=dict(facecolor='white',alpha=0.5,lw=0))
```

Practical 9 b: Solve Tipping Problem using fuzzy logic

```
import numpy as np
import skfuzzy as fuzz
from skfuzzy import control as ctrl
# New Antecedent/Consequent objects hold universe variables and membership
# functions
quality = ctrl.Antecedent(np.arange(0, 11, 1), 'quality')
```

```

service = ctrl.Antecedent(np.arange(0, 11, 1), 'service')
tip = ctrl.Consequent(np.arange(0, 26, 1), 'tip')
# Auto-membership function population is possible with .automf(3, 5, or 7)
quality.automf(3)
service.automf(3)
# Custom membership functions can be built interactively with a familiar,
# Pythonic API
tip['low'] = fuzz.trimf(tip.universe, [0, 0, 13])
tip['medium'] = fuzz.trimf(tip.universe, [0, 13, 25])
tip['high'] = fuzz.trimf(tip.universe, [13, 25, 25])
"""

```

To help understand what the membership looks like, use the ``view`` methods.

```

"""

```

You can see how these look with .view()

```

quality['average'].view()
"""

```

```

.. image:: PLOT2RST.current_figure
"""

```

```

service.view()
"""

```

```

.. image:: PLOT2RST.current_figure
"""

```

```

tip.view()
"""

```

```

.. image:: PLOT2RST.current_figure

```

Output :

SCSS

 Copy code

```
quality['average'].view()
```

This will generate a plot showing the triangular membership functions for the 'average' linguistic term. Similarly, you can view the membership functions for the 'service' input variable and the 'tip' output variable by adding the following lines of code:

SCSS

 Copy code

```
service.view()
tip.view()
```

Note that to use the ``.view()`` function, you need to have the matplotlib library installed. If you don't have it installed, you can install it with the following command:

```
pip install matplotlib
```
